NEXUS AI TECHNOLOGIES LTD

Business Plan & Innovation Funding Proposal

Nova Scotia, Canada | October 2026 | Draft for funding discussions

Intelligent solutions. Practical business value. Sustainable growth.

INITIAL NON-REPAYABLE GRANT TARGET $40,000 CAD
BROADER PHASED DEVELOPMENT GOAL $70,000 CAD
AVAILABLE STARTUP CAPITAL $1,500 CAD

Confidential working draft — prepared from founder-provided information. Actual incorporation status, market traction, financial assumptions and grant eligibility must be verified before external submission.

Executive summary

Nexus AI Technologies LTD is an early-stage, pre-revenue software and artificial intelligence venture being established in Nova Scotia. The business aims to help small and medium-sized organizations modernize websites, develop tailored applications, automate defined processes, integrate AI responsibly and understand their data.

The proposed model has two connected parts: near-term revenue from scoped client services, and longer-term potential from validated proprietary AI software. No paying customers or confirmed grant awards have been reported. The founder has approximately $1,500 in startup resources, will maintain outside full-time employment and plans no founder salary in Year 1.

Nexus seeks up to $40,000 in initial non-repayable support for a defined AI business automation and intelligence prototype, subject to finding a compatible program. The broader development ambition is $70,000 across potential later phases, not a single secured award. Funding would accelerate eligible technical development, testing and market validation; the services business must work independently of grant approval.

1. Company overview

Mission: Make secure, practical and well-designed digital technology more accessible to growing businesses. Vision: Build a durable Canadian technology company combining services, intelligent automation and eventually validated subscription products.

Current status: pre-revenue and in commercial preparation; the corporate name “LTD” is used as provided, but legal registration and ownership documentation require verification. Primary geography: Nova Scotia and Atlantic Canada, then remote Canadian customers where practical.

2. Customer problem and opportunity

Many smaller organizations lack in-house engineering teams yet face fragmented systems, repetitive tasks, limited digital presence and difficulty extracting value from business data. Nexus proposes outcomes-led engagements: clarify a business bottleneck, scope the smallest useful solution, build and validate it, and offer ongoing support where beneficial.

The addressable opportunity must be supported by current Canadian business statistics, interviews and qualified lead research before a grant application. A national count of small businesses is not equivalent to Nexus’s serviceable market or paying customers.

3. Products, services and pricing

Offering	Proposed price (CAD)	Commercial stage
Business website	$1,500–$3,000 / project	Service preparation
Premium website	$3,500–$8,000 / project	Service preparation
E-commerce	$3,000–$10,000 / project	Service preparation
Custom software	$5,000–$30,000+ / project	Service preparation

AI chatbot	$1,000–$4,000 / project	Prototype/implementation
AI workflows	$2,000–$15,000 / project	Prototype/implementation
BI dashboard	$1,500–$10,000 / project	Service/demo
AI/API integration	$1,000–$8,000 / project	Service preparation
Consulting	$100–$200 / hour	Service preparation
Website care	$75–$300 / month	Planned recurring service
AI/software care	$200–$1,000 / month	Planned recurring service
Proprietary SaaS	$29–$299 / month	Future, not launched

Prices are proposed ranges, not contracted selling prices. Quotations will reflect scope, billable effort, contractor expense, third-party charges and a suitable margin. Typical milestone terms may be 50% deposit, 25% at an agreed stage, 25% on acceptance, when appropriate.

4. Proposed proprietary innovation

Working project title: Nexus AI Business Automation & Intelligence Platform. Phase 1 is a narrowly scoped proof of concept, not a claimed finished enterprise product. Candidate capabilities include permissioned workflow automation, selected API/database connections, document retrieval, audit trails, human review steps, and operational summaries.

Technical approach: define measurable use cases; build modular interfaces and integrations; evaluate AI outputs, security and failure handling; then test with prospective users. Product decisions will be driven by observed customer problems rather than speculative subscriptions.

5. Research and development program

- Requirements and feasibility: select one or two industry use cases, define baseline manual workflow and measurable success criteria.
- Prototype engineering: backend/API integration, user experience, data ingestion and bounded model orchestration.
- Validation: repeatable functional evaluations, permission testing, error handling, cost/performance measurement and basic security review.
- Market evidence: structured interviews, prototype demonstrations, willingness-to-pay research and pilot feedback.
- Commercialization gate: proceed only if technical reliability, customer value, support cost and pricing appear viable.

6. Market and customers

Initial ideal buyers are owners, managers and operations leads at small organizations with a specific workflow or website problem, an identifiable decision-maker and budget. Candidate sectors include trades and contractors, professional services, local retail, and growth-stage companies. Focus begins with reachable Nova Scotia prospects, not an unproven claim of national market share.

Customer discovery should document the problem, existing workaround, economic impact, purchase cycle and ability to pay. A first outreach cohort and at least 10–15 structured interviews are proposed validation milestones, not completed traction.

7. Competitors and differentiation

Nexus competes with local agencies, freelancers, software consultancies, AI automation specialists and self-service tools such as website/CRM platforms. Larger rivals may have stronger portfolios and capacity. Nexus's intended differentiation is integrated software + AI + analytics delivery; direct founder communication; sensible use of existing platforms; transparent fixed scopes; attractive interface design; and ongoing support. These are strategic intentions to prove through client outcomes, not established market-leading claims.

8. Sales and customer communication

Funnel: research qualified prospects → tailored outreach → discovery call → project proposal with milestones → deposit and contract → staged delivery → acceptance → optional support. Early commercial emphasis is on a few small, profitable engagements that can be delivered while the founder remains employed elsewhere.

Communications: acknowledge inquiries within one business day where feasible; provide written scope and payment terms; update active clients weekly unless agreed otherwise; make no 24/7 support promise without staffed coverage. Respect privacy, permissions, client IP and Canadian commercial electronic messaging obligations.

9. Marketing and growth roadmap

Year 1: validate demand, launch corporate portfolio, test low-cost outreach, win initial clients and deliver a defined prototype. Year 2: build referrals and recurring maintenance services, standardize repeatable packages, validate pilots. Year 3: increase contract size and consider product commercialization or a developer hire only if signed work and cash flow sustain it.

The latest planned marketing budget is $1,660 / $4,100 / $6,700 across Years 1–3, as shown in the most recent financial report. Marketing should be released in stages; it is not all affordable upfront from $1,500 cash.

10. Operating model and personnel

Remote/home-based delivery, with secure repositories, version control, testing, client review environments, documentation and permissioned deployments. Founder is responsible for discovery, architecture, delivery and administration within available part-time hours. External specialists can be contracted for discrete funded/paid work packages.

Gross salary assumption	Year 1	Year 2	Year 3
Founder	$0	$12,000	$24,000
Developer	$0	$0	$42,000

Total gross salaries	$0	$12,000	$66,000
Employer cost allowance (12%)	$0	$1,440	$7,920

Years 2–3 staffing is conditional. The 12% employer cost is an estimate requiring actual payroll validation. Direct employee labour is split between COGS and indirect payroll in the financial model; the same labour must not be charged twice.

11. Three-year preliminary financial forecast

CAD	Year 1	Year 2	Year 3
Sales	$59,200	$89,600	$127,600
COGS	$0	$6,720	$50,736
Gross profit	$59,200	$82,880	$76,864
Indirect payroll + employer costs	$0	$6,720	$23,184
Other operating + marketing	$6,390	$11,960	$18,650
Profit before tax	$52,810	$64,200	$35,030
Income-tax model amount	$5,809	$7,062	$3,853
Net profit model amount	$47,001	$57,138	$31,177

These values reproduce the latest founder-supplied CanadaStartups P&L snapshot, not audited accounts or expected certainty. Current Year 1 COGS is $0, which likely omits customer-specific contractor, hosting, API and licensed-content expense. The sales figures have no supporting signed contracts and need a bottom-up customer/hour capacity model. Tax rate and timing depend on legal structure and tax rules.

12. Cash flow and balance-sheet caution

The model displays projected Year 1–3 ending cash of $54,310 / $118,510 / $153,540. It also reports year-end receivables of $29,600 / $44,800 / $63,800 while recording all yearly sales as cash collected; this must be reconciled. Cash income-tax payments and fixed asset purchases are omitted. These figures are NOT current cash resources, and should not be presented externally as validated liquidity.

Required before filing: monthly receipts based on deposit terms, realistic customer acquisition ramp, supplier payment timing, direct costs, tax timing and any fixed-asset purchases; reconcile retained earnings and the projected equity line. The base case should assume no grant award; a separate conditional award case can show eligible expense timing and reimbursement mechanics.

13. Non-repayable funding request and use of proceeds

Initial target: $40,000 for one defined technical validation project. The wider possible $70,000 plan comprises a hypothetical additional $30,000 phase and is not secured or assumed in forecasts. Do not present general working capital or promotional spending as eligible without program confirmation.

Proposed Phase 1 work package	Budget (CAD)
Core prototype engineering	$12,000
Architecture and integration	$6,000
Testing, QA and security	$5,000
Cloud and prototype infrastructure	$3,000
Customer discovery / pilot validation	$4,000
Distinct specialist contractor work	$6,000
Technical documentation / commercialization planning	$4,000
TOTAL	$40,000

Work-package scopes must be mutually exclusive, backed by quotations, and revised against selected program eligibility. With only $1,500 available, reimbursement-based programs create a financing obstacle that must be resolved before costs are incurred.

14. Milestones, KPIs and risk management

Project stage	Target deliverable	Evidence
Discovery	Defined use case + baseline	Interview notes, specification
Prototype	Working limited-function demo	Test environment, recorded demo
Validation	Reliability/security assessment	Evaluation and defect logs
Pilot	Prospective-user feedback	Consent-based pilot notes
Decision gate	Commercialization plan	Cost model, pricing and next-stage decision

Key risks: no validated demand, founder time constraints, underestimated delivery costs, dependency on third-party AI providers, privacy/security failures, grant ineligibility or reimbursement cash gaps. Mitigation includes small fixed-scope projects, staged expenditure, customer validation, access controls, test evidence, formal contracts and a no-grant downside case.

15. Intended local impact and conclusion

Nexus seeks to support smaller Canadian businesses with accessible digital tools while potentially developing intellectual property and future skilled contract or employment opportunities in Nova Scotia. These impacts are intended goals, not achievements to date.

Investment thesis: disciplined commercialization of a technically credible services offering, plus one focused innovation project whose outcomes can be measured. Nexus aims to earn commercial revenue, learn from customers and pursue product scale only after validation. The funding request is intended to accelerate this trajectory—not replace the need for paying customers.

Submission readiness checklist

- Verify corporate registration and official company legal name.
- Replace unsupported Year 1 sales and $0 direct costs with bottom-up forecasts and quotes.
- Reconcile accounts receivable, cash collection, taxes and equity balances.
- Select an open and eligible non-repayable program; adapt the project budget and matching/reimbursement plan.
- Collect evidence: demos, technical test logs, customer interviews, quotes, founder background and marketing pipeline.
